

Motorola Sales Dashboard

Power BI Data Analytics Project Report

An interactive business intelligence dashboard designed to analyze sales, quantity, transactions, customer ratings, payment methods, products, cities, and time-based performance.

1. Project Overview

The objective of this project is to transform sales data into an interactive Power BI dashboard that enables users to explore business performance through KPIs, charts, maps, filters, and comparative analysis.

The dashboard provides a consolidated view of sales activity and allows users to filter the analysis by month, brand, day name, mobile model, and payment method.

Tools & Technologies

Tool / Technology	Purpose
Microsoft Power BI	Dashboard development and visualization
Power Query	Data preparation and transformation
DAX	Measures and analytical calculations
Data Modeling	Organizing data for interactive analysis
Data Visualization	KPIs, charts, map and interactive reporting

2. Dashboard Components

- **KPI Cards:** Total Sales, Total Quantity, Transactions, and Average.
- **Sales by City:** Geographic visualization of sales activity across cities.
- **Monthly Quantity Trend:** Month-by-month comparison of total quantity.
- **Customer Ratings:** Distribution of customer ratings from 1 to 5.
- **Payment Method Analysis:** Transaction distribution across UPI, Debit Card, Cash, and Credit Card.
- **Product Analysis:** Comparison of quantity for selected mobile models.
- **Day-wise Sales:** Comparison of sales performance across days of the week.
- **Interactive Filters:** Month, Brand, Day Name, Mobile Model, and Payment Method.

3. Key Dashboard Metrics

Metric	Displayed Value
Total Sales	769M
Total Quantity	19K
Transactions	4K
Average	40K

4. Visual Insights

- The dashboard provides a high-level view of overall sales performance through KPI cards.
- Monthly quantity varies throughout the year, with visible peaks and declines that can be explored using the month filter.
- Customer ratings are concentrated toward the higher rating levels, indicating a strong positive rating distribution in the displayed report.
- Transactions are distributed across multiple payment methods, allowing comparison of customer payment preferences.
- The product comparison visual highlights iPhone SE, OnePlus Nord, and Galaxy Note 20 among the displayed models.
- The city map enables geographic exploration of sales activity across Indian cities.
- Day-wise sales visualization makes it possible to compare performance across weekdays and identify stronger and weaker days.

5. Interactivity

A key feature of the dashboard is its interactive filtering capability. Users can select months and use Brand, Day Name, Mobile Model, and Payment Method slicers to change the displayed analysis. This makes the dashboard useful for exploratory business analysis rather than being a static report.

6. Project Workflow

Stage	Activity
1. Data Preparation	Review and prepare the sales data for analysis.
2. Transformation	Use Power Query for cleaning and shaping data.
3. Modeling	Create an analytical data model suitable for reporting.
4. Calculations	Create DAX measures for KPIs and analysis.
5. Visualization	Build charts, KPI cards, map and slicers.
6. Validation	Review visuals, filters and displayed metrics.
7. Presentation	Prepare the dashboard for portfolio and professional sharing.

7. Skills Demonstrated

Power BI • Power Query • DAX • Data Modeling • Data Visualization • KPI Design • Interactive Reporting • Business Intelligence

8. Conclusion

This project demonstrates the ability to build an interactive Power BI dashboard that converts sales data into a structured visual analysis. The report combines summary KPIs with geographic, time-based, product, rating, and payment-method analysis, giving users multiple ways to explore business performance.

The project can be used as a portfolio example to demonstrate practical skills in Power BI, data preparation, DAX, visualization, and analytical storytelling.
